

Autnhive Launches First *Continuous Threat Exposure Management (CTEM)* Platform for AI Systems

Autnhive's SAMI (Security Assisted by Machine Intelligence) is the first CTEM platform that acts as a *Trusted Bidirectional Firewall* for both On Prem and Commercial AI systems, protecting the LLM, its users and customers from attacks or abuse.

Toronto, Canada, February 9, 2026 (GLOBE NEWSWIRE) — Autnhive Corporation™, a Canadian leader in proactive cybersecurity, today announced a major expansion of **SAMI, (Security Assisted by Machine Intelligence)** its cloud based, AI driven *Continuous Threat Exposure Management (CTEM)* platform that delivers autonomous, full-spectrum security for AI systems by design. SAMI eliminates the critical visibility and control gaps that leave today's AI deployments exposed.

SAMI now provides the world's first comprehensive, autonomous AI risk assessment, real-world attack simulation, and live firewall specialized for AI systems, including protection against dangerous prompts, prompt injection, RAG manipulation, Agentic Security, and MCP security through AI interactions. These attack vectors represent some of the most severe and least visible risks in modern enterprise AI environments today. With SAMI, they are no longer invisible.

Artificial intelligence is no longer experimental. AI systems now make decisions, access sensitive data, trigger actions, and operate at the core of business- and mission-critical infrastructure. Yet most organizations still rely on static rules, manual guardrails, and blind trust to secure AI. That approach is no longer viable.

SAMI fundamentally changes how AI is secured.

“Unsecured AI is an unacceptable risk,” said Devi Narayan, CEO of Autnhive Corporation™. “SAMI enforces security before, and during execution while AI is running, before threats become breaches.”

SAMI delivers continuous, real-time threat monitoring and runtime enforcement while AI systems are actively operating. It blocks malicious and unsafe prompts in real time, prevents data exfiltration through AI interactions, halts unauthorized or dangerous agent actions, and immediately alerts SOC teams when AI is under attack. With SAMI, AI attacks become security incidents, not silent failures. Security teams don't lose visibility; they gain total control.

SAMI's fire wall can be deployed on-prem, be cloud-based or delivered as SaaS. Its AI-driven CTEM platform secures full AI lifecycle.

In addition to live enforcement, SAMI autonomously assesses AI weaknesses and continuously simulates real-world AI attacks to determine what can actually be exploited in large language models (LLMs), agentic AI and their workflows, MCP, and Prompt resiliency while ensuring the security of AI supply chains, as well as AI governance and compliance.

These findings are prioritized and delivered directly to security operations teams (SOC's), enabling organizations to remediate real risk, not theoretical exposure.

Autnhive's SAMI establishes a new security baseline for AI. As AI becomes inseparable from enterprise operations, SAMI ensures organizations can deploy AI with confidence, control, and complete visibility without compromise.

About Autnhive

Autnhive, is a global leader in *Continuous Threat Exposure Management* (CTEM) through its flagship platform, **SAMI (Security Assisted by Machine Intelligence)**. The Company's mission is to deliver the most trusted and complete proactive security technology, empowering organizations to protect their entire digital stack across every layer of their operations.

Autnhive is pioneering the next generation of autonomous security operations. With offices in the U.S., Canada, and India and operations across North America, Latin America, Southeast Asia, Europe, and the Middle East, Autnhive enables the world's leading organizations to simplify and strengthen their cybersecurity posture.
